PRD v1.0 · 17 Oct 2026

Resonance: voice of customer intelligence

Upload customer calls. See what repeats across them. Read it in the customers' own words.

AUTHOR
Sachin Doddamani

PRIMARY USER
PM running customer discovery

STAGE
Pipeline built · prototype designed

SCOPE
v1 · single user · .docx transcripts

Measured from testing the pipeline on 2 real transcripts Hypothesis a target to validate Assumption not yet tested

01 Executive summary

PROBLEM
PMs can't see what repeats across 5 to 15 discovery calls, and can't prove it when challenged.

SOLUTION
A repository per initiative. Cross-call themes, each backed by the customer's exact quote, ending in a framed opportunity.

BET
PMs need defensible evidence more than another summary.

THREE DECISIONS THAT SHAPE THE PRODUCT

- **Quote first, summary second.** A paraphrase is not evidence.
- **The repository is the unit, not the meeting.** One call is a summary. Three or more is a pattern.
- **The tool stops where judgment starts.** It drafts the problem statement and leaves the hypothesis blank.

WHERE IT STANDS

BUILT
6-stage extraction pipeline, 7 claim types, cross-meeting matching. 2 transcripts, 209 claims, 35 themes.
95.9% of quotes verified as exact source text

PROTOTYPED
4 screens: repositories, workspace with 4 insight tabs, meeting detail, Frame as Opportunity. Illustrative data.

NOT BUILT
Upload endpoint, customer tagging, opportunity list, trends over time, hosting.

02 Problem statement

FAILURE	WHAT HAPPENS TODAY	CONSEQUENCE
Patterns are invisible	Notes are per call. A 60-minute call is roughly 8,000 to 10,000 words and nobody re-reads eight of them.	Memory favors what felt dramatic over what was mentioned quietly five times.
Recency and loud-voice bias	No counts across calls.	Roadmap follows the last or loudest customer.
AI summaries aren't trusted	Summaries paraphrase and carry no source.	PM can't defend a claim and returns to manual notes.
Insight isn't a decision	A theme can't go on a roadmap without framing.	Quotes get copy-pasted into docs by hand.

PMs running customer discovery can't reliably see what repeats across conversations, or prove it with customers' own words, so roadmap decisions drift toward whoever spoke last or loudest.

WHAT I KNOW VS. WHAT I'M ASSUMING

CLAIM	STATUS	HOW I'LL CHECK
Paraphrase drift is the core extraction problem	Observed	Quote accuracy was 48.7% at baseline; fixed to 95.9%.
Cross-meeting matching works	Observed	A call-2 claim reinforced a theme created by call 1.
PMs feel this pain enough to adopt a new tool	Assumed	8 to 10 PM interviews before any alpha.
PMs are allowed to upload customer calls	Unknown, riskiest	Ask in the same interviews. Start with redacted transcripts.

03 Background and market context

CATEGORY	EXAMPLES	GAP FOR A DISCOVERY PM
Meeting recorders and summarizers	Otter, Fireflies, Grain	One meeting at a time. Paraphrased. Not organized by initiative.
Research repositories	Dovetail	Quality depends on manual tagging. Built for researchers with time.
Revenue intelligence	Gong	Built for sellers. Discovery PM is a secondary user.
Feedback to roadmap	Productboard, Enterpret, Thematic	Strong on high volume of short text. Weaker on a few long conversations.

Based on public positioning, not a feature-by-feature teardown. Verify before quoting.

WHITESPACE

Small-n, high-richness analysis: 5 to 15 long calls, each carrying weight. Needs cross-call patterns, exact words and a decision frame.

REAL COMPETITOR

A PM pasting transcripts into a chat assistant. Fast, but no memory across sessions, no structure, no sources.

WHY NOW

1 Quotes can be checked in code, so trust is measurable

2 Small models run locally, so calls stay private

3 Teams and Zoom already produce transcripts

Tradeoff We don't do capture. That keeps scope small but ties us to other tools' export formats. Two real transcripts already had completely different structures, so format variance is a permanent cost.

04 Goals and non-goals

GOALS

- Cross-meeting patterns visible within minutes of upload
- Every insight verifiable in one step: quote, speaker, time, source
- Theme to framed opportunity without leaving the tool
- Understandable on first use, with no tagging scheme to learn

NON-GOALS

- **Recording or transcribing.** Crowded, not our edge
- **Full-text search.** Re-creates the re-reading problem
- **Roadmap management.** Ends at an opportunity
- **Recommending what to build.** Undercuts trust and PM judgment
- **Collaboration in v1.** Permissions before proof

Tradeoff Single-user is a real limit. The first sharing need is a lead reading curated evidence, which export covers (P2) at a fraction of the cost of collaboration.

05 Success metrics

NORTH STAR

Evidence-backed opportunities per active repository per month

Counts only when the opportunity cites quotes from 2 or more meetings.

WHY THIS ONE

It only rises if the whole loop works: upload, trust, act.

Rejected: uploads and page views. They measure activity, and a PM can upload 20 transcripts and learn nothing.

METRIC	TARGET	BASELINE TODAY	READ IT AS
ACTIVATION AND RETENTION			
Repos with 3+ meetings in 14 days	50%	Not measured	Cross-meeting value starts at meeting 3
Returns within 30 days with a new batch	40%	Not measured	Is it a habit or a one-off?
SPEED			
Upload to first insight, 60-min call	≤10 min	Several minutes for ~135 segments on a local GPU	Extraction is the slow stage. Hosted not benchmarked.
QUALITY AND TRUST			
Quotes verified as exact source text	≥95%	95.9% on 2 transcripts, 1 domain	Encouraging, not proven. Sample is small.
Claims approved without edit	≥80%	Not measured. 206 of 209 unreviewed.	Usefulness of extraction to the PM
Themes rejected as irrelevant	≤15%	Not measured. 2 of 35 were small talk.	Noise erodes trust in real themes
Themes where a source is opened	Watch only	Not measured	Ambiguous: trust or indifference. Interviews decide.

GUARDRAILS

- No insight is shown without a verified source quote. Failed checks are dropped, not displayed.
- Customer transcripts never train a model.
- Signal strength always traces back to its inputs.

06 User personas

Archetypes, not research findings. To be replaced with interview data.

Maya, the discovery PM — Primary

PM at a B2B software company. 6 to 12 customer calls per initiative over a month. Presents to leadership every other week.

Wants	To say "5 of 8 accounts raised this, here is what they said."
Pain	Re-reading notes, trusting memory, being asked for a source she can't find.
Trusts it when	The exact quote is on every card and the source is one click away.

Dev, the product lead — Secondary

Reads and challenges, rarely uploads

Wants	Evidence readable in two minutes without narration.
So	Insight views must stand alone and export.

Sam, customer success — Not v1

Sits on calls, passes recordings to product

Why not	A second uploader role adds permissions before the PM loop is proven.

Tradeoff Not designing for UX researchers (want tagging control) or sales managers (want rep coaching). Both are real markets, and both pull toward configuration and away from speed. Better to be clearly right for one persona than vaguely useful to four.

07 Jobs to be done

When I finish a round of customer calls, I want to see what came up repeatedly and in whose words, so I can decide what to pursue without relying on memory.

WHEN...	I WANT TO...	SO I CAN...
I have many transcripts and no time	See which problems repeat across calls	Separate patterns from one-offs
A stakeholder challenges a finding	Show exact quote, speaker, date	Defend it on the spot
A new call lands mid-initiative	See if it reinforces or opens a theme	Know if my picture is changing
A theme looks important	Turn it into a problem and hypothesis	Bring something decision-ready

SWITCHING FORCES

PUSH
Synthesis takes days. Last call dominates.

PULL
Patterns in minutes, quote attached.

ANXIETY
Can I upload this? Will it invent things? Did it miss something?

HABIT
Existing doc template and shared Notion.

Insight Most of the design answers the anxiety column. Verbatim quotes answer "will it invent things". Local-first answers "can I upload this". Unreviewed claims are labeled, not presented as fact.

08 Solution overview

1	2	3	4	5
Create repository	**Upload meetings**	**Read insights**	**Check the source**	**Frame opportunity**
One per initiative	.docx transcripts	Four lenses	Quote, speaker, time	Evidence to decision

SCREEN	JOB IT DOES
Repositories	Which initiative has a story? Counts plus the strongest pain signal per repo.
Workspace	Four tabs (pain, positives, improvements, emerging trends) of ranked theme cards: label, signal, meeting count, lead quote.
Meeting detail	"What came out of Tuesday's call?" All 7 claim types, grouped, with jump links.
Frame as opportunity	Evidence locked. Drafted problem. Who is affected. Signal read-only. Hypothesis empty.

PRINCIPLES

- **Evidence before interpretation.** The quote is on the card, not behind a click.
- **Claims are permanent, themes are disposable.** Relabel or merge themes without ever touching the evidence.
- **Show uncertainty.** Unreviewed claims are labeled. Signal strength shows its inputs.
- **One obvious next action.** Every theme card ends in Frame as opportunity.

DECISIONS AND WHAT EACH COSTS

DECISION	ALTERNATIVE	WHY	COST
Short label plus verbatim quote	Quotes only, or summary only	Label makes the list scannable. Quote makes it credible.	Taller cards, fewer per screen
Show unreviewed claims, labeled	Approved-only until reviewed	Approved-only gives an empty first screen. Value must arrive before review work.	Some early noise, contained by reject action
Four tabs by PM question	One ranked list	Hurts, works, wanted, new are different questions for different readers.	No single global ranking
Hypothesis left empty	AI drafts it too	It's the part that shows judgment. Pre-fill makes every opportunity read alike.	Slower for PMs wanting a full draft
Signal strength not editable	PM sets it	It exists to separate evidence from opinion.	Can't encode "this account matters more" yet
No expert-vs-participant roles in v1	Ask "who's the expert?" per upload	Adds a question at the worst moment for an unnoticed benefit.	Expert weighting in the score is inactive
Prototype on illustrative data	Wire a live model API	Fast, free to host, nothing sensitive uploaded to a demo.	Viewer can't try own transcript

> **Cold start** Themes only form once 15+ claims sit unassigned, so a first upload looks thin. This shapes onboarding (sample repo, a clear new-vs-reinforced summary) and the launch plan (process the first 3 transcripts together).

09 Feature requirements

P0 completes the loop (upload, insight, evidence, decision). **P1** makes it trustworthy and repeatable. **P2** can wait.

	FEATURE	PRI	STATUS	REQUIREMENT
REPOSITORIES				
R1	Repository list and create	P0	Prototyped	Name required. Cards show counts and top pain theme. Empty state explains the first upload.
INGESTION				
I1	Upload .docx	P0	Pipeline built	Drag and drop. Unsupported types rejected with the supported list.
I2	Staged progress	P0	Prototyped	Named stage plus position ("segment 12 of 28"). Survives refresh. Never an open-ended spinner.
I3	Visible parse failure	P0	Planned	Zero speaker turns shows what's wrong, supported formats and retry. Today it fails silently.
I4	New vs. reinforced summary	P0	Prototyped	"14 claims, 3 new themes, 2 reinforced", each linked. Makes the repo's memory visible.
I6	Customer tag at upload	P1	Planned	Company and segment. Without it, "who's affected" is guessed from speaker names.
INSIGHTS				
S1	Four insight tabs	P0	Prototyped	Pain, positives, improvements, emerging trends, each with a count.
S2	Theme card	P0	Prototyped	Label, signal, meeting count, lead quote with speaker, company, date, timestamp.
S3	Signal strength	P0	Prototyped	5 steps from the importance score (mentions + 2× meetings). Inputs on hover. Not editable.
S4	All quotes per theme	P0	Pipeline built	Expand to every quote, grouped by meeting. Rejected claims excluded.
S5	Meeting detail	P1	Prototyped	All 7 claim types for one call with jump links and theme tags.
S6	Open source in context	P1	Planned	Open transcript at that speaker turn. Locator already stored.
S7	Trends over time	P2	Planned	True trend lines. Until then "emerging" = theme in 2+ meetings including the latest.
OPPORTUNITIES				
O1	Frame as opportunity	P0	Prototyped	Locked evidence, drafted problem, editable audience, read-only signal, empty hypothesis.
O2	Opportunity list	P1	Planned	All saved opportunities by signal, linked to evidence. Prototype only flags a theme as saved.
O3	Evidence export, Jira push	P2	Planned	PDF or CSV of a theme with quotes, speakers, sources. Jira ticket pre-filled with problem and top quotes.
REVIEW				
Q1	Approve, reject, edit claim	P1	Pipeline built	Rejected claims hidden everywhere, never deleted. Edits recompute theme stats.
Q2	Theme relabel and status	P1	Pipeline built	Active, watching, resolved. Never touches claims.

Cut line One weekend means all P0 and nothing else. Review (Q1) is P1 on purpose: making it P0 forces a chore before the PM sees value. First item I'd pull forward is **I6**, the cheapest way to turn "someone said this" into "5 of 8 enterprise accounts said this".

10 User stories

	AS A PM, I WANT TO...	ACCEPTANCE CRITERIA
US-1	Create a repository for one initiative, so calls stay grouped by the question I'm answering.	Name required. New repo shows zero counts and an upload prompt.
US-2	See what's happening while a transcript processes, so I can decide whether to wait.	Named stage plus position. State survives closing the page.
US-3	See what each upload added, so I know how this call changed my picture.	Counts of claims, new themes, reinforced themes. Each links to its card.
US-4	Read top pains in customers' exact words, so I can repeat them with confidence.	Label, signal, meeting count, lead quote shown as spoken, filler included.
US-5	Check where a quote came from, so I can answer a challenge on the spot.	Speaker, company, date, timestamp. All quotes grouped by meeting.
US-6	Tell a pattern from one loud voice.	Meeting count on every card. Trends tab lists themes in 2+ meetings.
US-8	Frame a theme as an opportunity, so I leave with something roadmap-ready.	Evidence locked. Problem drafted and editable. Hypothesis empty. Signal read-only. Card shows "framed".
US-9	Reject an irrelevant claim or theme, so small talk doesn't pollute insights.	Gone from all views and counts. Retained in storage.
US-11 P2	(As a product lead) read a theme's evidence without logging in.	Export has label, signal, quotes, speakers, sources.

11 Non-functional requirements

AREA	REQUIREMENT	TARGET
Trust	Every quote is an exact substring of the source, checked in code. Failures dropped.	≥95%. 95.9% measured on 2 docs
Performance	Upload to first insight. UI interactions after load.	≤10 min for 60-min call. <200 ms navigation
Privacy	No training on user data. Repos isolated. Deleting a repo deletes all derived data.	Local-first. Hosted demo uses synthetic data only
Scale	Theme formation, matching, ranking tested only at 2 docs, 209 claims.	Validate at ~50 docs, ~2,000 claims before beta
Accessibility	Keyboard operable. No color-only meaning (badges carry text).	WCAG 2.1 AA contrast
Cost	Track model cost per transcript from first alpha.	Target set after measurement. Drives pricing

12 Out of scope

NOT IN V1	WHY	REVISIT WHEN
Audio, video, PDF ingestion	Transcripts cover the core use. Each format multiplies parsing edge cases.	A quarter of alpha users ask unprompted
Real-time insights	Different latency and a different user moment.	Post-call loop proven, users ask
Team workspaces, permissions	Heavy before single-user is validated.	Export is heavily used
Integrations beyond Jira	Endless work, unclear demand.	Alpha shows a clear destination tool
Internal meeting mode	Different persona. Emphasis on decisions and actions.	Discovery loop works, users ask
Theme merge and split	Matters only once duplicates appear at scale.	Scale test shows duplicate themes
Auto-prioritization	Undermines PM judgment and product trust.	Not planned

13 Dependencies and risks

DEPENDENCIES

1 Extraction model and prompt quality
2 Teams and Zoom export formats
3 GPU or hosted compute
4 Customer consent and company policy

RISK	LIKELY	IMPACT	MITIGATION
PMs can't upload customer calls (consent, policy)	Med	High	Ask in first interviews. Redacted-transcript path. Local-first option and a clear data-handling note.
Extraction biased to the prompt's domain	Med	High	Test on 3+ unrelated domains before alpha. 4 of 5 worked examples are one domain, and 3 of 7 claim types have none. Fix first.
Cold start: first upload looks thin	High	Med	Sample repo. Process first 3 transcripts together. Explicit new-vs-reinforced summary.
Small talk becomes a theme and looks like a bug	High	Med	Reject action on themes, "off-topic?" prompt. No auto-filter: relevance is a judgment call.
Quality or ranking degrades at volume	Med	High	Scale test at ~50 docs with a defined pass bar before beta.
Silent parse failures on new formats	High	Med	Ship I3 before any external user. Turn failing files into adapter tests.
PMs treat ranking as a verdict	Med	Med	Label as evidence strength, not importance. Hypothesis stays human-written.
Cost per transcript exceeds what people will pay	Med	High	Measure from first alpha. Decide pricing and model after that number exists.

OPEN QUESTIONS

- One batch per initiative, or meetings dripped in over weeks? Changes how much the new-vs-reinforced summary matters.
- Do leads read in the tool or only receive exports? Decides when sharing moves up.
- Does account weighting ("this customer is worth 10× that one") belong in the signal, or break the evidence-only promise?

14 Go-to-market and launch plan

For product managers running customer discovery, Resonance is the evidence workspace that shows what repeats across calls, in customers' own words. Unlike meeting summarizers, every insight links to an exact quote.

FIRST USERS

PMs at B2B software companies who run their own customer calls and report to a product lead.

RISKIEST ASSUMPTIONS, IN TEST ORDER

1. They can upload real calls. 2. Output on their own transcripts is good enough to act on. 3. Patterns change decisions, so they return. 4. Someone pays more than model cost.

PRICING HYPOTHESIS

Free alpha, then per-seat with a cap on active repos. Decide only after cost per transcript is measured. No paid acquisition until retention is proven.

Phase 0 Now	**Prototype and story.** Clickable prototype, this PRD, 3-minute walkthrough. Exit: someone unfamiliar can explain the problem back to me.
Phase 1 Weeks 1 to 4	**Interviews, then concierge alpha.** 8 to 10 PM interviews. Then 4 to 5 PMs: I process their redacted transcripts by hand and send results, before building the upload endpoint. Exit: 3 of 5 would use it on their next initiative.
Phase 2 Weeks 5 to 12	**Private beta, ~20 PMs.** Build upload, I3, I6, O2. Run the scale test first. Watch: repos reaching 3 meetings in 14 days, cost per transcript, quote verification on real data.
Phase 3 Week 12	**Decision point.** Continue, change direction, or stop against the gates below.

LAUNCH GATES

- Quote verification ≥95% across 3+ domains
- Parse failures visible, common ones supported
- Scale test passes at ~50 docs
- Cost per transcript known and below a price users named

WHAT WOULD CHANGE MY COURSE

- **<30% return with a 2nd batch.** One-off tool, not a repository
- **Can't get upload approval.** Go local-only or target teams with consent processes
- **Themes read but not acted on.** Problem is decisions, so make framing the core

Prepared by Sachin Doddamani · Resonance PRD v1.0 · Figures marked Measured come from pipeline testing on two real transcripts. All others are targets or assumptions and are labeled as such.
